                                                       The invention relates to a method for increasing isoflavonoid production in a plant, by transforming the plant with a recombinant DNA construct having a polynucleotide (PN) e.g., a PN encoding all or part of flavanone 3-hydroxylase, and second recombinant DNA construct having a PN encoding Cl myb and a R myc-type transcription factor, growing the transformed plant, and evaluating the quantity of isoflavonoid from the plant. The method of the invention is useful for increasing isoflavonoid production in an isoflavonoid-producing plant. The current sequence represents the seed-specific expression vector pKS151, into which a polynucleotide encoding a portion of soybean flavanone 3-hydroxylase was inserted in an example from the invention, for the transformation of Glycine max.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               may play a defense role against pathogens in plant tissues. The present sequence represents the nucleotide sequence of a seed-specific expression vector pKS151.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Increasing isoflavonoid production in an isoflavonoid-producing plant, comprises transforming a plant with recombinant DNA constructs, growing the transformed plant, and evaluating increased quantity of isoflavonoid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADF67892 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 7701 BP; 2236 A; 1702 C; 1709 G;

                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for increasing isoflavonoid production in a plant, by transforming the plant with a recombinant DNA construct having a polynucleotide (PN) e.g., a PN encoding all or part of flavanone 3-hydroxylase, and second recombinant DNA construct having a PN encoding C1 myb and a R myc-type transcription factor, growing the transformed plant, and evaluating the quantity of isoflavonoid from the plant. The method of the invention is useful for increasing isoflavonoid production in an isoflavonoid-producing plant. The current sequence represents the seed-specific expression vector pKS151, into which a polynucleotide encoding a portion of soybean flavanone 3-hydroxylase was inserted in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Increasing isoflavonoid production in an isoflavonoid-producing plant, comprises transforming a plant with recombinant DNA constructs, growing the transformed plant, and evaluating increased quantity of isoflavonoid

```

stem comprises a sequence of ADQ07968). The promoter is a seed-specific promoter. The method is useful for decreasing the ratio of liquiritigenin derived isoflavones relative to the total isoflavones in an isoflavone-producing plant. The methods and recombinant construct are useful in producing an isoflavonoid-containing product which is incorporated in cereal food product, snack food product, baked good product, fried food product, health food product, infant formula, beverage, nutritional supplement, dairy product, pet food product, or animal feed. The present sequence is the Seed specific gene silencing vector pKS151, into which the soybean cDNA is cloned (into the NotI site flanked by the stem

Decreasing ratio of liquiritigenin-derived isoflavones relative to toti isoflavones in a plant comprises transforming plant cell with nucleic acid sequence showing homology to sequence encoding chalcone reductase (deoxychalcone synthase). total

Example 1; SEQ ID NO 1; 25pp; English.

CC producing plant comprising transforming a plant cell with a recombinant CC producing plant comprising transforming a plant cell with a recombinant CC construct comprising a promoter operably linked to a nucleic acid CC cidentity to ADD07965 (a soybean chalcone reductase CDNA). Also included are an isoflavonoid-producing plant made by the method above, seeds or CC plant parts of the plant, an isoflavonoid-containing protein product CC thaving a reduced rattio of liquiritigenin-derived isoflavones relative to the total isoflavone levels obtained from the seeds or plant parts, a food (or a nutritional supplement, a food bar, or a beverage) which has incorporated the isoflavonoid-containing product, and a method of CC promoters an isoflavonoid-containing product, and a method of CC quirititigenin-derived isoflavones relative to the total isoflavone (CC promoter. The recombinant construct comprises a stem-loop structure. The comprises a sequence forms a loop in the stem-loop structure and the containing product. The producing plant. The method is useful for decreasing the ratio of liquiritigenin cereal food product, snack food product, baked good product, firled food product, health food product, infant formula, beverage, nutritional comproduct and isoflavone-present sequence is the Seed specific gene silencing vector pXS151, into which the stem objects of the soybean cDNA is cloned (into the NotI site flanked by the stem The invention relaties to decreasing the ratio of liquiritigenin-derived isoflavones relative to the total isoflavones in an isoflavonoidregions of ADQ07968.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC Polynucleotide fragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the CC phosphoglucomutase activity. An isolated polynucleotide that affects the CC least of expression of a plastidic phosphoglucomutase polypeptide in a CC least 541 nucleotides, measuring the level of the polypeptide in the CC plant cell containing the polynucleotide, and comparing the level of the polypeptide in the CC the level of the plant cell containing the isolated polynucleotide with CC the level of the polypeptide in a plant cell that does not contain the CC isolated polynucleotide. A method for altering the level of expression of CC a plastidic phosphoglucomutase protein in a host cell comprises CC isolated polynucleotide. A method for altering the level of expression of CC cell under conditions that are suitable for expression of the chimeric CC gene, where the expression of the gene results in production of altered CC levels of plastidic phosphoglucomutase. This sequence represents plasmid CC levels of plastidic phosphoglucomutase. This sequence is not represented in the printed specification but is based on sequence is not of conformation supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated polypeptides having phosphoglucomutase activity and polynucleotides encoding the polypeptides, useful for producing transgenic plants with altered plastidic phosphoglucomutase protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to plastidic phosphoglucomutase polypeptides and cc transgenic plant, by transforming a plant cell with a polypucleotide of the invention and regenerating a plant from the transformed plant cell. CC Polynucleotide fragments are useful for suppressing the level of cc expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the cc level of expression of a plastidic phosphoglucomutase polypeptide in a cc plant cell can be identified by introducing a DNA fragment comprising at cc plant cell containing the polynucleotide, and comparing the level of the polypeptide in the cc plant cell containing the polynucleotide, and comparing the level of the polypeptide in a plant cell that does not contain the cc isolated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises cc ransforming a host cell with a chimeric gene and growing the transformed cc levels of plastidic phosphoglucomutase. This sequence represents plasmid CC levels of plastidic phosphoglucomutase. This sequence is not cc represented in the printed specification but is based on sequence is not conformation supplied by the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                         thus altering the level of mono, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFIP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is plasmid pB868 which is used for the suppression of diverged delta-9 desaturase in high stearate phenotypes. This sequence is used in the exemplification of the invention. Note: The sequence data for this sequence (AAD32909) corresponding to position 1501 to 6611 is not represented in the printed specification but is based on the sequence information supplied by the European patent office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lover levels than normal or in coll transpositions.
 pBS68 plasmid used for diverged delta-9 desaturase suppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New delta-9 fatty acid desaturase polypeptides and polynucleotides, useful in creating transgenic plants having altered levels of mono-, po and unsaturated fatty acids and in increasing the unsaturation levels
                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 6611 BP; 1831 A; 1472 C; 1453 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell types or developmental stages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. CC proteins and polynucleotides encoding such proteins. The nucleic acid CC sequences may be used to increase the level of unsaturation in cellular CI lipids, including oil, in tissues when the enzyme is absent or rate-cc limiting, to isolate cDNAs and genes encoding homologous proteins from CC the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in CC cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in CC those cells. They are useful as probes for genetic and physical gene CC (RFLP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is plasmid pBS68 which is used for the suppression of diverged delta-9 ce semplification of the invention. Note: The sequence is used in the exemplification of the invention. Note: The sequence data for this sequence (AAD32909) corresponding to position 1501 to 6611 is not represented in the printed specification but is based on the sequence information supplied by the European patent office
                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                       Query Match

                                        level of expression of a plastidic phosphoglucomutate polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polypeptide, and comparing the level of the polypeptide in the plant cell containing the isolated polynucleotide with the level of the polypeptide in a plant cell that does not contain the isolated polynucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered levels of plastidic phosphoglucomutase. This sequence represents an artificial DNA used for plasmid construction, in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated polypeptides having phosphoglucomutase activity and polynucleotides encoding the polypeptides, useful for producing transgenic plants with altered plastidic phosphoglucomutase protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic
                                                                                                                                                                                                                                                                                                          The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17-JUL-2001; 2001EP-00306143
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EP1174510-A2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Plastidic phosphoglucomutase; transgenic; plant; gene;

The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide in a plant cell that does not contain the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          05-JUN-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABK10711;

construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glassman

A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered levels of plastidic phosphoglucomutase. This sequence represents an artificial DNA used for plasmid construction, in the methods of the

The present sequence is 2X ELVISLIVES complementary region from pBS149 that contains fragments from two soybean galactinol synthase genes GAS1 and GAS2. The region is functionally attached to a late-soybean-embryo promoter (LEA) and a phaseolin 3' terminator region. This entire region is then cloned into BamHI site of pKS136, which contains a 2X ELVISLIVES complementary region controlled by a soybean Kti promoter and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (DUPO )

The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least on target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived it. The present sequence is 2X ELVISLIVES complementary region from New recombinant construct having a promoter operably linked to sequence which when expressed produces an RNA having homology t mRNA and its reverse complement unrelated to endogenous DNA, fo Example 10; expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pBS149 that contains fragments from two soybean galactinol synthase genes GAS1 and GAS2. The region is functionally attached to a late-soybean-embryo promoter (LEA) and a phaseolin 3' terminator region. This entire region is then cloned into BamHI site of pKS136, which contains a 2X ELVISLIVES complementary region controlled by a soybean Kti promoter and terminator region used in the exemplification of the invention
                                                                                             New recombinant construct having a promoter operably linked to a DNA sequence which when expressed produces an RNA having homology to a tament and its reverse complement unrelated to endogenous DNA, for red

Claim 45; Page 37;

77pp; English

New recombinant construct having a promoter operably linked to a DNA sequence which when expressed produces an RNA having homology to a target mRNA and its reverse complement unrelated to endogenous DNA, for reducing gene expression.

```
RESULT 22

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid

The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is 1X ELVISLIVES complementary repeat region DNA found in plasmids pKS106 and pKS124 used in the exemplification of the
                          New delta-9 fatty acid desaturase polypeptides and polynucleotides, useful in creating transgenic plants having altered levels of mono-, poly - and unsaturated fatty acids and in increasing the unsaturation levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diverged delta-9 fatty acid desaturase; enzyme; cellular lipid; oil; transgenic plant; gene mapping; immunisation; plasmid pKS124;

limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which the polypeptides are present at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found, thus altering the level of mono-, poly- and unsaturated fatty acids in those cells. They are useful as probes for genetic and physical gene mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce antibodies specific for the peptides and proteins. The present sequence is 1X ELVISILVES complementary repeat region DNA found in plasmids pKS106 and pKS124. This sequence is used in the exemplification of the invention for the suppression of Fad2 in soybean
Sequence 80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to diverged delta-9 fatty acid desaturase proteins and polynucleotides encoding such proteins. The nucleic acid sequences may be used to increase the level of unsaturation in cellular lipids, including oil, in tissues when the enzyme is absent or rate-lipids, to isolate CDNAs and genes encoding homologous proteins from the contract of the contract of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 9; Page 43; 77pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC proteins and polynucleotides encoding such proteins. The nucleic acid CC sequences may be used to increase the level of unsaturation in cellular CC lipids, including oil, in tissues when the enzyme is absent or rate-cC limiting, to isolate cDNAs and genes encoding homologous proteins from the same or other plant species and to create transgenic plants in which CC the same or other plant species and to create transgenic plants in which CC they competides are present at higher or lower levels than normal or in CC thus altering the level of mono-, poly- and unsaturated fatty acids in CC those cells. They are useful as probes for genetic and physical gene CC mapping and as markers, e.g. restriction fragment length polymorphism (RFLP) markers. The peptides can be used to immunise animals to produce is 1X ELVISLIVES complementary repeat region DNA found in plasmids pXS106 and pXS124. This sequence is used in the exemplification of the invention CC for the suppression of Fad2 in soybean

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                transferning a plant cell with a polymucleotide of the invention and regenerating a plant from the transformed plant cell. CC Polymucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polymucleotide that affects the cc phosphoglucomutase activity. An isolated polymucleotide that affects the clavel of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at compart cell can be identified by introducing a DNA fragment comprising at plant cell containing the level of the polypeptide in the plant cell containing the isolated polymucleotide with the collected polymucleotide. A method for altering the level of expression of a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed cc cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered clevels of plastidic phosphoglucomutase. This sequence represents an artificial DNA used for plasmid construction, in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                   Novel isolated polypeptides having phosphoglucomutase activity and polynucleotides encoding the polypeptides, useful for producing transgenic plants with altered plastidic phosphoglucomutase protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to plastidic phosphoglucomutase polypeptides an their related nucleic acids. The sequences are seful for producing a transgenic plant, by transforming a plant cell with a polynucleotide the invention and regenerating a plant from the transformed plant cel
                                                                                                                                                                                                                          17-JUL-2000; 2000US-0218712F

The sequences are useful for producing a CC transgenic plant, by transforming a plant cell with a polynucleotide of CC the invention and regenerating a plant from the transformed plant cell. CC plant cell eragments are useful for suppressing the level of CC expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the CC level of expression of a plastidic phosphoglucomutase polypeptide in a CC plant cell can be identified by introducing a DNA fragment comprising at CC least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide with CC plant cell containing the polynucleotide, and comparing the level of the polypeptide in a plant cell that does not contain the CC polypeptide in the plant cell containing the isolated polynucleotide with CC isolated polynucleotide. A method for altering the level of expression of isolated polynucleotide. A method for altering the level of expression of cell under conditions that are suitable for expression of the chimeric gene and growing the transformed CC levels of plastidic phosphoglucomutase. This sequence represents an CC invention

S 밁 Ś

The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISLIVES
                                                                                                                                                                                                                                                                                                                                                                                                                          Glassman KF,

The present invention relates to a new recombinant construct. The construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expression of a target recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from
                                                                                                                                                                                                                                                   New recombinant construct having a promoter operably linked to a DNA sequence which when expressed produces an RNA having homology to a target mRNA and its reverse complement unrelated to endogenous DNA, for reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from it. The present sequence is a PCR primer used for amplifying ELVISIIVES complementary region DNA used in the exemplification of the invention

                                                                          construct comprises a promoter operably linked to a DNA sequence which when expressed by a host produces an RNA having homology to at least one target mRNA expressed by the host and complementary RNA regions. The recombinant construct is useful for reducing the expression of a target mRNA or any similar endogenous mRNA. The RNAs expressed from the recombinant constructs are also used in reducing expression of a target mRNA or any similar endogenous mRNA. The sequences and their reverse complements can be used to reduce the expression of any endogenous genomic sequence that shares substantial similarity to nucleic acid fragment which is in proximity to the DNA or RNA sequence derived from pBS68 which contains 2X ELVISIIVES complementary regions surrounding the the nucleotide Fad2-1 NotI fragment from pKS11 and a nucleotide fragment from a soybean delta-9 desaturase gene used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                it. The present sequence is an analysis complementary regions surrounding the which contains 2X ELVISLIVES complementary regions surrounding the nucleotide Fad2-1 NotI fragment from pKS111 and a nucleotide fragment from a soybean delta-9 desaturase gene used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant construct having a promoter operably linked to a DNA sequence which when expressed produces an RNA having homology to a tamRNA and its reverse complement unrelated to endogenous DNA, for red
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Glassman KF,

                                                                                             The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a transgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide in a plant cell of the polypeptide in a plant cell that does not contain the isolated polynucleotide. A method for altering the level of expression of a plant cell that does not contain the isolated polynucleotide. A method for altering the level of expression of
a plastidic phosphoglucomutase protein in a host cell comprises transforming a host cell with a chimeric gene and growing the transformed cell under conditions that are suitable for expression of the chimeric gene, where the expression of the gene results in production of altered levels of plastidic phosphoglucomutase. This sequence represents an artificial DNA used for plasmid construction, in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated polypeptides having phosphoglucomutase activity and polynucleotides encoding the polypeptides, useful for producing transgenic plants with altered plastidic phosphoglucomutase protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SXS
                           The invention relates to plastidic phosphoglucomutase polypeptides and their related nucleic acids. The sequences are useful for producing a cransgenic plant, by transforming a plant cell with a polynucleotide of the invention and regenerating a plant from the transformed plant cell. Polynucleotide fragments are useful for suppressing the level of expression of a gene encoding a polypeptide having plastidic phosphoglucomutase activity. An isolated polynucleotide that affects the level of expression of a plastidic phosphoglucomutase polypeptide in a plant cell can be identified by introducing a DNA fragment comprising at least 541 nucleotides, measuring the level of the polypeptide in the plant cell containing the polynucleotide, and comparing the level of the polypeptide in the polypeptide in the polypeptide in the polypeptide in the polypeptide. A method for altering the level of contain the containing the level of the polypeptide. A method for altering the level of contain the containing the level of a plastidic phosphoglucomutase protein in a host cell comprises that the containing the level of the polypeptide in the plant cell with a chimeric gene and growing the transformed that the containing the level of the polypeptide that a plant cell comprises that the containing the level of the polypeptide that the containing the level of the polypeptide in the plant cell with a chimeric gene and growing the transformed that the containing the level of the polypeptide that a chimeric gene and growing the transformed that the containing the level of the polypeptide that a chimeric gene and growing the transformed that the chimeric gene and growing the transformed that the chimeric gene and growing the transformed that the containing the level of the polypeptide that the chimeric gene and growing the transformed that the chimeric gene and growing the transformed that the chimeric gene and growing the transformed that the containing the level of the polypeptide that the chimeric gene and growing the polypeptide that t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated polypeptides having phosphoglucomutase activity and polynucleotides encoding the polypeptides, useful for producing transgenic plants with altered plastidic phosphoglucomutase protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   05-JUN-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                        The present invention relates to a method for identifying a modulator of quorum sensing signalling in bacteria. The method comprises: providing a cell that comprises a quorum sensing controlled gene (ADS14446-ADS14798), where the cell is responsive to a quorum sensing signal molecule such that a detectable signal is generated; contacting the cell with a quorum sensing signal molecule in the presence and absence of a test compound; and detecting a change in the detectable signal. The method and modulator identified by the method are useful for treating a biofilm-associated disease or disorder, e.g. cystic fibrosis, AIDS, middle ear infections, acne, periodontal disease, catheter-associated infections, and medical device-associated infections. Note: The sequence data for this patent was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                            The present invention relates to a method for identifying a modulator of quorum sensing signalling in bacteria. The method comprises: providing a cell that comprises a quorum sensing controlled gene (ADS14446-ADS14798), where the cell is responsive to a quorum sensing signal molecule such that a detectable signal is generated; contacting the cell with a quorum sensing signal molecule in the presence and absence of a test compound; and detecting a change in the detectable signal. The method and modulator identified by the method are useful for treating a biofilm-associated disease or disorder, e.g. cystic fibrosis, ADIS, middle ear infections, acne, periodontal disease, catheter-associated infections, and medical device-associated infections. Note: The sequence data for this patent was obtained in electronic format directly from WIPO at

New rice promoter, useful for manipulating crop plants to alter or improve phenotypic characteristics, e.g. produce large quantities or proteins, resistance to insecticides, virus or fungi, stress to proteins, resista value. tolerance of oil

Claim 25; QES ID NO 1055; 230pp; English

leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential or constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant genome and a method of identifying a gene, where its expression is altered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower, canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, sorghum, rice or wheat. The polynucleotides and the polypeptides they encode are useful for manipulating crop plants to alter or improve phenotypic characteristics, to produce large quantities of oil or proteins, to incur resistance to insecticides, viruses or fungi, and to incur stransc to generate to alter or fungi, and to incur stress tolerance (e.g. salt, cold or drought) to ensure the plants have a high nutritional value with reduced apical dominance or dwarfism, early flowering or altered metabolic pathways. This sequence represents a plant nucleic acid of the invention. Note: The sequence data for this invention relates to plant nucleotide sequences that direct seed-

This sequence represents a plant nucleic acid of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     or constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant genome and a method of identifying a gene, where its expression is altered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower, canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, sorghum, rice or wheat. The polynuclectides and the polypeptides they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; probe; ss; gene expression; single exon probe; microarray; alternative splicing event; genomic alteration.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc encoding at least 8 amino acids of any of the 6888 amino acid sequences chilly defined in the specification. The probe is a single exon probe that cc hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-cc addressable set of single exon nucleic acid probes for measuring human comprising a plurality of single exon nucleic acid probes is separately combes cited above, where each of the plurality of probes is separately cand addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of contiguous amino acids of any of the above mentioned amino acid sequences (optionally with conservative amino acid substitutions), an cc isolated antibody that binds specifically to a peptide cited above, an oRF-encoded peptide comprising at least 8 cmethods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing thuman gene expression data by subscription, and a computer-readable exon grapes endium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene contains the probes may be used as tools for surveying creations in the genomic locus that includes their exon, in assessing sallition, the probes are used in identifying and characterising gross calternative splicing events, in detecting and characterising cross calternative splicing the ORF-encoded peptide. The spresses of mucleic acids, or in expressing the ORF-encoded peptide. The sequence is a human considered in the probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained confidence in the command of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 39
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a nucleic acid probe for measuring human gene cexpression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and conding at least 8 amino acids of any of the 6888 amino acid sequences controlled that the specification. The probe is a single exon probe that the third sex of single exon nucleic acid molecule captressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human gene expression (comprising a plurality of single exon nucleic acid molecule captressed addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a vector comprising the single exon probe cited above, an ORF-encoded peptide comprising the single exon probe cited above, an ORF-encoded peptide comprising the single exon probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid sequences (optionally with conservative amino acid substitutions), an occurrence of sequences of selling and/or licensing single exon probes or microarrays to constitute antibody that binds specifically to a peptide cited above, an occurrence of expression, a method of providing the numan gene expression data by subscription, and a computer-readable capture record including data on the expression of a single exon probe capture of the probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their capecific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising gross alternative splicing events, in detecting and characterising gross alternative splicing events, in detecting and characterising gross alternative splicing events, in priming the synthesis of nucleic acids, or in expression captured by the split of
                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                     The present invention relates to recombinant DNA vectors (cosmids) that encode for the narbonolide polyketide synthase (PKS) enzyme and various narbomycin modification enzymes from Streptomyces narbonensis. The recombinant DNA vectors can be used to produce recombinant ketide synthases and a variety of different polyketides (e.g. erythromycin, rapamycin, tylosin, narbomycin, picromycin, methylmycin and neomethymycin) for use in agriculture, medicine and health. The recombinant vectors may be used to produce polyketides in relatively high yields. AAS18432-AAS18443 represent contig DNA sequences that encode for

                                                                            ADL91894 standard; DNA; 1681
                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to recombinant DNA vectors (cosmids) that encode for the narbonolide polyketide synthase (PKS) enzyme and various narbomycin modification enzymes from Streptomyces narbonensis. The recombinant DNA vectors can be used to produce recombinant ketide synthases and a variety of different polyketides (e.g. erythromycin,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              synthase gene from Streptomyces narbonensis. The DNA sequence of the invention are useful for providing polyhydroxyalkanoate monomer for medical and industrial applications. The present DNA sequence represents a Streptomyces narbonensis narbonolide polyketide synthase coding sequence of the invention.

The DNA sequence of the invention are useful for providing polyhydroxyalkanoate monomer for medical and industrial applications. The present DNA sequence represent a Streptomyces narbonensis narbonolide polyketide synthase coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17-APR-2001;

                                                                                                                                á
                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                  particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). This sequence encodes the polypeptides shown in AAUG740-AAUG7444 and AAUG8011. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved infections of bone, joints and the central nervous system, however it is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Propionibacterium acnes immunogenic polypeptides. The proteins and associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders
